Specification: ... valve parts rotatably mounted together with a snap arrangement where the second valve part is adapted to cooperate with the first valve part to open and close an air inlet and a fluid outlet of each of the first and ... the bottle. The fluid control aperture communicates with the fluid outlets of the first and second valve parts during fluid dispensing. The present invention also relates to a method of dispensing fluid from a bottle including rotating one...

Specification: ...linkage assembly, the preferred embodiment of the present invention requires a mechanism for further reducing air flow through intake manifold 20, during the linkage lost-motion interval. Referring again to Figure 1, intake manifold 20 is provided with a passage 76, which bypasses the throttle valve formed by throttle 74. Within passage 76 is a bypass valve 78 for restricting airflow. The position of bypass valve 78 with respect to passage port 80 in the intake manifold 20, determines the amount of air bypassing the throttle valve. Computer 48 remotely controls the position of bypass valve 78 by sending an appropriate...

Specification: ...that change incessantly.

Alternatively, the engine may effect exhaust gas recirculation for a predetermined cylinder of a multiple cylinder engine so as to obtain a detection signal detecting the intake flow rate of this cylinder, stop exhaust gas recirculation for other cylinders so as to obtain detection signals detecting the intake....detection values.

Accordingly, the exhaust gas recirculation flow rate can be detected immediately, accurately and reliably at all times in response to the change of the engine load and number of revolution and further, in accordance with various conditions... 11. This intake air flow rate sensor 29 detects the air flow impinging against a heating wire through which a current flows, by the change of the resistance value of the heating wire, and the signal from this intake air....sensor 29 is inputted to an intake air flow rate processor 30 and can detect the intake air flow rate flowing through each intake port 11. The intake air flow rate thus detected is inputted to the controller 15.

The controller 15 comprises a microcomputer and is equipped with a central processing unit...

Specification: ...the outlet-side casing. The valve head is so shaped that, with respect to the valve opening degree defined by the surface of the valve head and the valve seat, the rate of change of flow rate with valve stroke is small and linear, and the valve stroke to fully open the valve is provided in the inlet-side casing.

Although the foregoing object of the present invention... plurality of liquids to prepare a liquid mixture and for metrically distributing the liquid mixture by closed-loop liquid measuring means in which a velocity of flow is allowed to change continuously. The apparatus comprises: a plurality of supply tanks respectively filled with liquids as raw... ..tanks to which

the mixed liquid in the mixer tank is distributed; a plurality of opening-regulated (flow-control) valves respectively associated with the supply tanks and the distribution tanks for restricting flow rates, each... control valves having a dead zone where no flow rate is generated within a predetermined range; a detector arranged at the mixer for measuring liquids; a measurement control unit for performing fuzzy control on the basis of actual values measured by the...

Detailed Description:

...valve parts rotatably mounted together with a snap arrangement where the second valve part is adapted to cooperate with the first valve part to open and close an air inlet and a fluid outlet of each of the first and...the bottle. The fluid control aperture communicates with the fluid outlets of the first and second valve parts during fluid dispensing.

The present invention also relates to a method of dispensing fluid from a bottle including rotating one...
